(54) Title: BACTERIAL SMALL-MOLECULE THREE-HYBRID SYSTEM

(57) Abstract: A transgenic bacterial cell comprising (a) a dimeric small molecule which comprises a first moiety known to bind a first receptor domain covalently linked to a second moiety known to bind a second receptor domain; (b) nucleotide sequences which upon transcription encode i) a first fusion protein comprising the first receptor domain, and ii) a second fusion protein comprising the second receptor domain; and (c) a reporter gene wherein expression of the reporter gene is conditioned on the proximity of the first fusion protein to the second fusion protein. The cell is also adapted for use in a method for identifying a molecule that binds to a known target in a bacterial cell from a pool of candidate molecules, and a method for identifying an unknown target receptor to which a molecule is capable of binding in a bacterial cell. Also described are compounds and kits for carrying out the methods.

INTERNATIONAL SEARCH REPORT

International application No.

PCT/US03/12612

Box I Observations where certain claims were found unsearchable (Continuation of Item 1 of first sheet)

This international report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☐ Claim Nos.:
because they relate to subject matter not required to be searched by this Authority, namely:
2. ☐ Claim Nos.:
because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:
3. ☐ Claim Nos.:
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box II Observations where unity of invention is lacking (Continuation of Item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:
Please See Continuation Sheet

1. ☐ As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:
4. ☒ No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.: 1-29, and 70-71

Remark on Protest

☐
☐

The additional search fees were accompanied by the applicant's protest.

No protest accompanied the payment of additional search fees.

BOX II. OBSERVATIONS WHERE UNITY OF INVENTION IS LACKING

This application contains the following inventions or groups of inventions which are not so linked as to form a single general inventive concept under PCT Rule 13.1. In order for all inventions to be examined, the appropriate additional examination fees must be paid.

Group I, claims 1-29 and 70-71 are drawn to a transgenic bacterial cell comprising a 1st moiety covalently linked to a different 2nd moiety; (b) nucleotide sequences encoding: i) 1st fusion protein comprising 1st receptor domain and DHFR domain and ii) 2nd fusion protein comprising a 2nd receptor domain, and (c) a reporter gene, and kits thereof (1st composition).

Group II, claims 30-69 are drawn to a method for identifying a molecule that binds a known and unknown target receptor in a bacterial cell from a pool of molecules comprising (a) forming a dimeric molecule, (b) introducing the dimeric molecule into a bacterial cell culture, (c) permitting the dimeric molecule to bind to the 1st fusion protein, (d) selecting the bacterial cell, and (e) identifying the small molecule that binds the known and unknown target receptor (1st method of using).

Group III, claims 72 is drawn to a process for screening a chemical library for a molecule (2nd method)

Group IV, claim 73 is drawn to a molecule (1st product).

Group V, claims 74 is drawn to a process for screening a cDNA library for a nucleic acid (3rd method).

Group VI, claims 75-80 are drawn to an isolated nucleic acid and a transgenic bacterial cell comprising (a) a dimeric small molecule, (b) nucleotide sequence encoding i) a 1st fusion protein and 1st fragment of an enzyme and ii) a 2nd fusion protein comprising the receptor domain and a 2nd fragment of the enzyme (2nd product/composition).

Group VII, claims 81-82 are drawn to a method for identifying a known and unknown molecule (1st method of using 2nd composition).

The inventions listed as Groups I-VII do not relate to a single general inventive concept under PCT Rule 13.1 because, under PCT Rule 13.2, they lack the same or corresponding special technical features for the following reasons: The special technical feature of Invention I is the 1st transgenic bacterial cell composition and methods of making and using the same. The special technical feature of using the II, III, and V are drawn to methods of identifying a molecule, process for screening a chemical library, and screening a cDNA library, respectively. Although the 1st product of the invention and method of making and using is a permitted combination under PCT Rule 13.2, in the instant case, the special technical is already disclosed in the art. For example, Dove, S.L. *et al.* (Nature 386: 627-630) teach a reporter construct of a λ cl two-domain protein that binds DNA as a dimer, and pairs of dimers bind cooperatively to adjacent operator sites (Fig. 2a). Dove, S.L. *et al.* further teach a construct derivative of the lac promoter of a single λ operator ($O_{\lambda}2$) centered upstream of the transcription startpoint and introduced it in a single copy in to the chromosome of *E. coli* (Fig. 3a). Therefore, the special technical feature is not a unifying feature. The special technical features of Inventions III, IV are process for screening and a molecule (method of using and 2nd product). The special technical of Inventions VI and VII are drawn to the 2nd product/composition and method of using the same, respectively. The same holds true in regard of lack of unity determination under PCT Rule 13.2 for these inventions described supra, as it further noted that technically, the absence of a special technical feature would permit the separation of the method of using and product/composition(s).

Docket No: 66855-A-PCT/JPW/GJG

BACTERIAL SMALL-MOLECULE THREE-HYBRID SYSTEM

5 This application claims priority of U.S. Serial No. 10/132,039, filed April 24, 2002, the contents of which are herein incorporated by reference into this application.

This invention has been made with government support under
10 National Institutes of Health grant GM62867. Accordingly, the U.S. Government has certain rights in the invention.

Throughout this application, various publications are referenced by Arabic numerals in parentheses. Full citations for these
15 publications may be found at the end of the specification immediately preceding the claims. The disclosures of these publications in their entireties are hereby incorporated by reference into this application in order to more fully describe the state of the art as known to those skilled therein as of the
20 date of the invention described and claimed herein.

Field of Invention

This invention relates to the field of identifying protein targets and their corresponding small-molecule drugs and other
25 biomolecules using the techniques of chemically induced dimerization ("CID").

Background of the Invention

Affinity chromatography has long been used to identify the
30 protein targets of small-molecule drugs and other biomolecules. While an essential tool for biochemical research, affinity chromatography can often be labor intensive and time consuming. Recently the yeast three-hybrid assay, a derivative of the two-

-2-

hybrid assay, was introduced a straightforward, in vivo alternative to affinity chromatography (1,2). The yeast two-hybrid system relies on the interaction of two fusion proteins to bring about the transcriptional activation of a reporter gene thus identifying protein-protein interactions in an in vivo system (2). The subsequently developed yeast three-hybrid system screens for a small molecule-protein interaction based on the principle that small ligand-receptor interactions underlie many fundamental processes in biology and form the basis for pharmacological intervention of human diseases in medicine (3). In the three-hybrid assay, protein-small-molecule interactions are detected as reconstitution of a transcriptional activator ("TA") and subsequent transcription of a reporter gene (4-7). A dimeric small-molecule ligand bridges the DNA-binding domain ("DBD") of the TA, which is fused to the receptor for one ligand, and the activation domain ("AD") of the TA, which is fused to the receptor for the other ligand. For affinity chromatography applications, one ligand-receptor pair is used as an anchor and the other is the small-molecule-protein interaction being investigated. While the yeast three-hybrid assay is quite powerful, a bacterial equivalent would increase the number of proteins that could be tested by several orders of magnitude because the transformation efficiency and doubling time of *E. coli* is significantly greater than that of *S. cerevisiae*. In addition, there may be applications where it is advantageous to test a eukaryotic protein in a prokaryotic environment where many pathways are not conserved.

However, the yeast three-hybrid assay cannot be transferred directly to bacteria. The components of the transcription machinery and the mechanism of transcriptional activation differ

-3-

significantly between bacteri yeast. Ligand-receptor pairs often are organism specific because of cell permeability, toxicity, or other interactions with the cellular milieu. Bacterial two-hybrid assays have only begun to be developed in the past few years (8) and to date only initial efforts toward the design of a robust bacterial three-hybrid system have been reported (9, 10). Described below is the first robust small-molecule bacterial three-hybrid system.

Summary of the Invention

This invention provides a transgenic bacterial cell comprising
(a) a dimeric small molecule which comprises a first moiety
known to bind a first receptor domain covalently linked to
5 a second moiety capable of binding a second receptor
domain, wherein the first and second moieties are
different;

(b) nucleotide sequences which upon transcription encode

i) a first fusion protein comprising the first
10 receptor domain, and

ii) a second fusion protein comprising the second
receptor domain; and

(c) a reporter gene wherein expression of the reporter
gene is conditioned on the proximity of the first fusion
15 protein to the second fusion protein.

This invention also provides a method for identifying a molecule
that binds a known target receptor in a bacterial cell from a
pool of candidate molecules, comprising:

20 (a) forming a dimeric molecule by covalently bonding each
molecule in the pool of candidate molecules to a ligand
capable of selectively binding to a receptor;

(b) introducing the dimeric molecule into a bacterial cell
culture comprising bacterial cells that express a first
25 fusion protein which comprises the known target receptor
domain against which the candidate molecule is screened, a
second fusion protein which comprises the receptor domain
to which the ligand selectively binds, and a reporter gene
wherein expression of the reporter gene is conditioned on
30 the proximity of the first fusion protein to the second
fusion protein;

-5-

(c) permitting the dimeric molecule to bind to the first fusion protein and to the second fusion protein, bringing the two fusion proteins into proximity so as to activate the expression of the reporter gene;

5 (d) selecting the bacterial cell that expresses the reporter gene; and

(e) identifying the small molecule that binds the known target receptor.

10 This invention further provides a method for identifying an unknown target receptor to which a known molecule is capable of binding in a bacterial cell, comprising:

(a) providing a dimeric molecule having a first ligand which has a specificity for the unknown target receptor covalently bonded to a second ligand capable of selectively
15 binding to a receptor;

(b) introducing the dimeric molecule into a bacterial cell which expresses a first fusion protein which comprises the unknown target receptor domain, a second fusion protein
20 which comprises the receptor domain to which the second ligand selectively binds, and a reporter gene wherein expression of the reporter gene is conditioned on the proximity of the first fusion protein to the second fusion protein;

25 (c) permitting the dimeric molecule to bind to the first fusion protein and to the second fusion protein so as to activate the expression of the reporter gene;

(d) selecting which bacterial cell expresses the unknown target receptor; and

30 (e) identifying the unknown target receptor.

This invention also provides a transgenic bacterial cell comprising

(a) a dimeric small molecule which comprises a methotrexate moiety covalently linked to a moiety capable of binding a receptor domain;

(b) nucleotide sequences which upon transcription encode

i) a first fusion protein comprising a DHFR domain and a first fragment of an enzyme, and

ii) a second fusion protein comprising the receptor domain and a second fragment of the enzyme, wherein activity of the enzyme is conditioned on the proximity of the first fragment of the enzyme to the second fragment of the enzyme.

This invention further provides a method for identifying a molecule that binds a known target receptor in a bacterial cell from a pool of candidate molecules, comprising:

(a) forming a dimeric molecule by covalently bonding each molecule in the pool of candidate molecules to a methotrexate moiety;

(b) introducing the dimeric molecule into a bacterial cell culture comprising bacterial cells that express a first fusion protein which comprises the known target receptor domain against which the candidate molecule is screened, and a first fragment of an enzyme, and a second fusion protein which comprises a DHFR receptor domain and a second fragment of the enzyme;

(c) permitting the dimeric molecule to bind to the first fusion protein and to the second fusion protein, bringing the first fragment and the second fragment of the enzyme in to proximity so as to reconstitute the activity of the

-7-

enzyme;

(d) selecting the bacterial cell that exhibits the activity of the enzyme; and

(e) identifying the small molecule that binds the known target receptor.

This invention also provides a method for identifying an unknown target receptor to which a known molecule is capable of binding in a bacterial cell, comprising:

(a) providing a dimeric molecule having a first ligand which has a specificity for the unknown target receptor covalently bonded to a methotrexate moiety;

(b) introducing the dimeric molecule into a bacterial cell which expresses a first fusion protein which comprises the unknown target receptor domain, and a first fragment of an enzyme, and a second fusion protein which comprises a DHFR receptor domain and a second fragment of the enzyme;

(c) permitting the dimeric molecule to bind to the first fusion protein and to the second fusion protein, bringing the first fragment and the second fragment of the enzyme in to proximity so as to reconstitute the activity of the enzyme;

(d) selecting the bacterial cell that exhibits the activity of the enzyme; and

(e) identifying the unknown target receptor.

Also provided by this invention is are kits for carrying out the methods.

Description of the Figures

Figure 1. Bacterial RNA polymerase two- and three-hybrid systems. (A) Dove and Hochschild built a bacterial two-hybrid system based on their observation that λ CI-mediated recruitment of RNA polymerase is sufficient to activate gene transcription. The DNA operator of λ CI is placed upstream of the RNA polymerase binding site for a *lacZ* reporter gene. Using the known interaction between the proteins, Gal4 and Gal11^P, as a proof of principle, they showed that co-expression of λ CI-Gal4 and α NTD-Gal11^P fusion proteins was sufficient to activate transcription of the *lacZ* gene. λ CI binds to its operator and through the binding of Gal4 and Gal11^P is effectively associated with α NTD. α NTD is the N-terminal domain of the α -subunit of RNA polymerase and is used to localize the entire RNA polymerase machinery to the RNA polymerase binding site and thus promote transcription of the *lacZ* gene. (B) In our bacterial three-hybrid system, the interaction between λ CI and α NTD is provided by a heterodimeric small molecule, Mtx-SLF. Mtx-SLF bridges between the fusion proteins, λ CI-FKBP12 (the receptor for SLF) and α NTD-DHFR (the receptor for Mtx), activating transcription of the *lacZ* reporter gene.

Figure 2. Retrosynthetic analysis of Mtx-SLF.

25

Figure 3. β -Galactosidase assays establish that transcriptional activation is small-molecule dependent in the bacterial three-hybrid system. X-Gal indicator plates are shown for the different constructs used to verify the three-hybrid system. Each column corresponds to strain V674E bearing plasmids

30

-9-

expressing λ CI and α NTD fusion proteins involved in the RNA polymerase two- and three-hybrid assays: 1, λ CI-Gal4, α NTD-Gal11^P; 2, λ CI, α NTD; 3, λ CI-FKBP12, α NTD; 4, λ CI-FKBP12, α NTD-DHFR; 5, λ CI, α NTD-DHFR. 1 is the Gal4-Gal11^P direct protein-protein interaction used as a positive control. 2, 3, and 5 lack both of the necessary receptor proteins to test the necessity of all three components for transcriptional activation. Plate A contains no Mtx-SLF; and plate B, 10 μ M Mtx-SLF. The plates are LB solid media containing 40 mg/mL X-Gal, 0.5 mM IPTG, 0.5 mM tPEG, 100 mg/mL ampicillin, and 6 mg/mL chloramphenicol.

Figure 4. The levels of small-molecule induced transcriptional activation were quantified using liquid *lacZ* assays. The strains here correspond exactly to those in Figure 2 and are used in liquid ONPG assays where the levels of transcriptional activation can be quantitated based on the amount of reporter protein, β -galactosidase, which is produced. The strains are V674E bearing plasmids encoding λ CI and α NTD fusion proteins: 1, λ CI-Gal4, α NTD-Gal11^P; 2, λ CI, α NTD; 3, λ CI-FKBP12, α NTD; 4, λ CI-FKBP12, α NTD-DHFR; 5, λ CI, α NTD-DHFR. The strains were assayed in triplicate from three transformants and standard deviations are shown. The strains are grown in LB with 0.5 mM IPTG, 100 μ g/mL ampicillin, 6 μ g/mL chloramphenicol, and small molecules at the indicated concentration. 1 is the Gal4-Gal11^P direct protein-protein interaction Mtx-SLF independent positive control. Only 4 contains both receptor proteins for Mtx-SLF as the other strains lack either one or both of the receptor proteins. The last two small-molecule concentrations are competition assays in which an excess of one of the ligands for

-10-

the receptor proteins was used to compete out the positive signal due to the three-hybrid system.

Figure 5. The levels of transcriptional activation depend on Mtx-SLF concentration in the bacterial three-hybrid system. The concentrations of Mtx-SLF in the media were varied, and the levels of *lacZ* transcription were quantitated in liquid culture using ONPG. The strains are V674E expressing the following λ CI and α NTD fusion proteins: (\blacklozenge), λ CI-Gal4, α NTD-Gal11^P (a direct protein-protein interaction); (\blacksquare), λ CI-FKBP12, α NTD (a negative control); and (\blacktriangle), λ CI-FKBP12, α NTD-DHFR (the three-hybrid system). The rate of ONPG hydrolysis was measured in triplicate from three different transformants after growth in LB media containing 0.5 mM IPTG, 100 μ g/mL ampicillin, 6 μ g/mL chloramphenicol, and Mtx-SLF at the indicated concentrations. The standard deviation for each data point is also shown.

-11-

Detailed Description of the Invention

This invention provides a transgenic bacterial cell comprising

(a) a dimeric small molecule which comprises a first moiety known to bind a first receptor domain covalently linked to a second moiety capable of binding a second receptor domain, wherein the first and second moieties are different;

(b) nucleotide sequences which upon transcription encode

i) a first fusion protein comprising the first receptor domain, and

ii) a second fusion protein comprising the second receptor domain; and

(c) a reporter gene wherein expression of the reporter gene is conditioned on the proximity of the first fusion protein to the second fusion protein.

The dimeric small molecule may have the formula:

wherein each of H1 and H2 may be the same or different and capable of binding to a receptor which is the same or different with a IC_{50} of less than 100 μM ; and Y is a linker which may be present or absent. Each of H1 and H2 can be capable of binding to a receptor with a IC_{50} of less than 10 μM ; or with a IC_{50} of less than 1 μM ; or with a IC_{50} of less than 100 nM; or with a IC_{50} of less than 10 nM; or with a IC_{50} of less than 1 nM.

Each of H1 and H2 may be a methotrexate moiety, FK506 moiety, an FK506 analog, a tetracycline moiety, or a cephem moiety. In a preferred embodiment, H1 or H2 is a methotrexate moiety. In another preferred embodiment, H1 or H2 is an FK506 analog. The

-12-

FK506 analog may have the structure:

In a specific embodiment, the dimeric small molecule may have the structure:

wherein n is an integer from 1 to 20, preferably n is an integer from 2 to 12, more preferably n is an integer from 3 to 9, in a specific embodiment, n is 8.

The first fusion protein can further comprise a DNA binding domain, and the second fusion protein can further comprises a transcription activation domain. Alternatively, the first fusion protein can further comprises a transcription activation domain, and the second fusion protein can further comprises a DNA binding domain.

The transcription activation domain can be α NTD. The DNA-

-13-

binding domain can be λ CI, AraC, LexA, Gal4, or zinc fingers.

The first or the second receptor domain can be that of dihydrofolate reductase ("DHFR"), glucocorticoid receptor, FKBP12, FKBP mutants, tetracycline repressor, or a penicillin binding protein. The DHFR can be the *E.coli* DHFR ("eDHFR").

In a specific embodiment, the first fusion protein is DHFR- λ CI or FKBP12- λ CI; and the second fusion protein is DHFR- α NTD or FKBP12- α NTD.

The reporter gene can be Lac Z, araBAD, aadA (spectinomycin resistance), his3, β -lactamase, GFP, luciferase, TetR (tetracycline resistance), KanR (kanamycin resistance), or Cm (chloramphenicol resistance). In a specific embodiment, the reporter gene is Lac Z.

This invention also provides a transgenic bacterial cell comprising

- (a) a dimeric small molecule which comprises a methotrexate moiety covalently linked to a moiety capable of binding a receptor domain;
- (b) nucleotide sequences which upon transcription encode
 - i) a first fusion protein comprising a DHFR domain, and
 - ii) a second fusion protein comprising the receptor domain; and
- (c) a reporter gene wherein expression of the reporter gene is conditioned on the proximity of the first fusion protein to the second fusion protein.

-14-

The elements of this cell are defined previously.

This invention also provides a method for identifying a molecule that binds a known target receptor in a bacterial cell from a pool of candidate molecules, comprising:

(a) forming a dimeric molecule by covalently bonding each molecule in the pool of candidate molecules to a ligand capable of selectively binding to a receptor;

(b) introducing the dimeric molecule into a bacterial cell culture comprising bacterial cells that express a first fusion protein which comprises the known target receptor domain against which the candidate molecule is screened, a second fusion protein which comprises the receptor domain to which the ligand selectively binds, and a reporter gene wherein expression of the reporter gene is conditioned on the proximity of the first fusion protein to the second fusion protein;

(c) permitting the dimeric molecule to bind to the first fusion protein and to the second fusion protein, bringing the two fusion proteins into proximity so as to activate the expression of the reporter gene;

(d) selecting the bacterial cell that expresses the reporter gene; and

(e) identifying the small molecule that binds the known target receptor.

In the method, the steps (b)-(e) of the method can be iteratively repeated in the presence of a preparation of random small molecules for competitive binding with the screening molecule so as to identify a molecule capable of competitively binding the known target receptor.

-15-

The dimeric molecule in the method can be obtained from a combinatorial library. The dimeric molecule in the method can comprise a ligand capable of selectively binding to a receptor with a IC_{50} of less than 100 μM ; or with a IC_{50} of less than 10 μM ; or with a IC_{50} of less than 1 μM ; or with a IC_{50} of less than 100 nM; or with a IC_{50} of less than 10 nM; or with a IC_{50} of less than 1 nM.

The dimeric molecule in the method can comprises a methotrexate moiety, FK506 moiety, an FK506 analog, a tetracycline moiety, or a cephem moiety. In a specific embodiment, the dimeric molecule comprises a methotrexate moiety. In another specific embodiment, the dimeric molecule comprises an FK506 analog.

The FK506 analog can have has the structure:

The first fusion protein in the method can further comprise a DNA binding domain, and the second fusion protein further comprises a transcription activation domain. Alternatively, the first fusion protein in the method can further comprise a transcription activation domain, and the second fusion protein further comprises a DNA binding domain.

-16-

The transcription activation domain can be α NTD.

The DNA-binding domain can be λ cI, AraC, LexA, Gal4, or zinc fingers.

5

The first or the second fusion protein in the method can comprise a receptor domain of dihydrofolate reductase ("DHFR"), glucocorticoid receptor, FKBP12, FKBP mutants, tetracycline repressor, or a penicillin binding protein. The DHFR can be the

10

E. coli DHFR ("eDHFR").

In the method, the first fusion protein can be DHFR- λ cI or FKBP12- λ cI. The second fusion protein can be DHFR- α NTD or FKBP12- α NTD.

15

The reporter gene can be *Lac Z*, *araBAD*, *aadA*, *his3*, β -lactamase, GFP, luciferase, TetR, KanR, Cm. In a specific embodiment, the reporter gene is *Lac Z*.

20 This invention also provides a method for identifying an unknown target receptor to which a known molecule is capable of binding in a bacterial cell, comprising:

(a) providing a dimeric molecule having a first ligand which has a specificity for the unknown target receptor covalently bonded to a second ligand capable of selectively

25

binding to a receptor;

(b) introducing the dimeric molecule into a bacterial cell which expresses a first fusion protein which comprises the unknown target receptor domain, a second fusion protein which comprises the receptor domain to which the second

30

-17-

ligand selectively bind and a reporter gene wherein expression of the reporter gene is conditioned on the proximity of the first fusion protein to the second fusion protein;

5 (c) permitting the dimeric molecule to bind to the first fusion protein and to the second fusion protein so as to activate the expression of the reporter gene;

(d) selecting which bacterial cell expresses the unknown target receptor; and

10 (e) identifying the unknown target receptor.

The unknown target receptor is encoded by a DNA from the group consisting of genomicDNA, cDNA and syntheticDNA.

15 The steps (b)-(e) of the method can be iteratively repeated so as to identify the unknown target receptor.

The other elements of this method are as defined previously.

20 This invention also provides a kit for identifying a molecule that binds to a known target in a bacterial cell from a pool of candidate molecules, comprising

(a) a host bacterial cell containing a reporter gene that is expressed only when bound to a DNA-binding domain and when in the proximity of a transcription activation domain;

25 (b) a first vector containing a promoter that functions in the host bacterial cell and a DNA encoding a DNA-binding domain;

(c) a second vector containing a promoter that functions in the host bacterial cell and a DNA encoding a transcription activation domain;

30

-18-

(d) a dimeric small molecule which comprises a moiety that binds to a known receptor domain covalently linked to a candidate molecule;

5 (e) a means for inserting into the first vector or the second vector a DNA encoding the known receptor domain in such a manner that the known receptor domain and an expression product of the first or second vector are expressed as a fusion protein;

10 (f) a means for inserting into the first vector or the second vector a DNA encoding the known target receptor in such a manner that the known target receptor and an expression product of the first or second vector are expressed as a fusion protein; and

15 (g) a means for transfecting the host cell with the first vector, and the second vector, wherein binding of the dimeric small molecule to the known target receptor results in a measurably greater expression of the reporter gene than in the absence of such binding.

20 The elements of this kit are as defined previously.

This invention further provides a kit for identifying an unknown target receptor to which a molecule is capable of binding in a bacterial cell, comprising

25 (a) a host bacterial cell containing a reporter gene that is expressed only when bound to a DNA-binding domain and when in the proximity of a transcription activation domain;

(b) a first vector containing a promoter that functions in the host bacterial cell and a DNA encoding a DNA-binding domain;

30 (c) a second vector containing a promoter that functions in

-19-

the host bacterial cell DNA encoding a transcription activation domain;

(d) a dimeric small molecule which comprises a moiety that binds a known receptor domain covalently linked to a moiety against which the unknown target is to be screened for binding;

(e) a means for inserting into the first vector or the second vector a DNA encoding the known receptor domain in such a manner that the known receptor domain and an expression product of the first or second vector are expressed as a fusion protein;

(f) a means for inserting into the first vector or the second vector a DNA encoding the unknown target receptor in such a manner that the unknown target receptor and an expression product of the first or second vector are expressed as a fusion protein; and

(g) a means for transfecting the host cell with the first vector, and the second vector, wherein binding of the dimeric small molecule to the unknown target receptor results in a measurably greater expression of the reporter gene than in the absence of such binding.

The elements of this kit are as defined previously.

This invention yet further provides a process for screening a chemical library for a molecule that binds a known target receptor, comprising providing a chemical library, providing a bacterial cell that expresses the known target receptor as a part of a fusion protein, and identifying the molecule that binds the known target receptor in the bacterial cell by the method described above. As a result, this invention also

-20-

provides a molecule identified by the method, wherein the molecule was not previously known to bind the known target receptor.

5 This invention yet further provides a process for screening a cDNA library for a nucleic acid that encodes a receptor to which a known molecule binds, comprising providing a cDNA library, providing a dimeric molecule having two ligands, of which one ligand is the known molecule, and identifying the nucleic acid
10 that encodes the receptor to which the known molecule binds by the method described above. As a result, this invention also provides an isolated nucleic acid identified by the process, wherein the isolated nucleic acid was not previously known to encode a receptor to which the known molecule binds. The
15 isolated nucleic acid can encode an enzyme or a portion thereof.

This invention also provides a transgenic bacterial cell comprising

- 20 (a) a dimeric small molecule which comprises a methotrexate moiety covalently linked to a moiety capable of binding a receptor domain;
- (b) nucleotide sequences which upon transcription encode
 - i) a first fusion protein comprising a DHFR domain and a first fragment of an enzyme, and
 - 25 ii) a second fusion protein comprising the receptor domain and a second fragment of the enzyme, wherein activity of the enzyme is conditioned on the proximity of the first fragment of the enzyme to the second fragment of the enzyme.

30

The elements of the cell are as described above.

This invention also provides a method for identifying a molecule that binds a known target receptor in a bacterial cell from a pool of candidate molecules, comprising:

- 5 (a) forming a dimeric molecule by covalently bonding each molecule in the pool of candidate molecules to a methotrexate moiety;
- (b) introducing the dimeric molecule into a bacterial cell culture comprising bacterial cells that express a first
10 fusion protein which comprises the known target receptor domain against which the candidate molecule is screened, and a first fragment of an enzyme, and a second fusion protein which comprises a DHFR receptor domain and a second fragment of the enzyme;
- 15 (c) permitting the dimeric molecule to bind to the first fusion protein and to the second fusion protein, bringing the first fragment and the second fragment of the enzyme in to proximity so as to reconstitute the activity of the enzyme;
- 20 (d) selecting the bacterial cell that exhibits the activity of the enzyme; and
- (e) identifying the small molecule that binds the known target receptor.

25 The elements of this method are as defined previously.

This invention also provides a method for identifying an unknown target receptor to which a known molecule is capable of binding in a bacterial cell, comprising:

- 30 (a) providing a dimeric molecule having a first ligand which has a specificity for the unknown target receptor

-22-

covalently bonded to a methotrexate moiety;

(b) introducing the dimeric molecule into a bacterial cell which expresses a first fusion protein which comprises the unknown target receptor domain, and a first fragment of an enzyme, and a second fusion protein which comprises a DHFR receptor domain and a second fragment of the enzyme;

(c) permitting the dimeric molecule to bind to the first fusion protein and to the second fusion protein, bringing the first fragment and the second fragment of the enzyme in to proximity so as to reconstitute the activity of the enzyme;

(d) selecting the bacterial cell that exhibits the activity of the enzyme; and

(e) identifying the unknown target receptor.

The elements of this method are as defined previously.

Each of the ligand halves of the dimeric small molecule may be derived from a compound selected from the group consisting of steroids, hormones, nuclear receptor ligands, cofactors, antibiotics, sugars, enzyme inhibitors, and drugs.

Each of the ligand halves of the dimeric small molecule may also represent a compound selected from the group consisting of 3,5,3'-triiodothyronine, trans-retinoic acid, biotin, coumermycin, tetracycline, lactose, methotrexate, FK506, and FK506 analogs.

In the described methods, the screening is performed by Fluorescence Associated Cell Sorting (FACS), or gene transcription markers selected from the group consisting of

-23-

Green Fluorescence Protein, LacZ, galactosidases, luciferase, antibiotic resistant b-lactamases, and yeast markers.

The known moiety that binds a known receptor domain can be a
5 Methotrexate moiety or an analog thereof. The known receptor domain can be dihydrofolate reductase ("DHFR") generally, or the *E.coli* DHFR ("eDHFR"). Alternatively, the pairing can be FK506/FKBP12, AP series of synthetic FK506 analogs/FKBPs, tetracycline/tetracycline repressor, cephem/penicillin binding
10 protein. The penicillin binding domain can be from *Streptomyces* R61.

Each of the methods is readily adapted to identify which
substrate from a pool of candidate substrates is selected in a
15 cell by a known enzyme for a bond forming reaction between the substrate and a known amino acid.

The described methods, cell and kit may also be adapted to identify new protein targets for pharmaceuticals.

20

The described methods, cell and kit may also be adapted for determining the function of a protein, further including screening with a natural cofactor being part of the CID.

25

The described methods, cell and kit may also be adapted for determining the function of a protein, further including screening with a natural substrate being part of the CID.

30

The described methods, cell and kit may also be adapted for screening a compound for the ability to inhibit a ligand-receptor interaction.

-24-

The foregoing embodiments of a subject invention may be accomplished according to the guidance which follows. Certain of the foregoing embodiments are exemplified. Sufficient guidance is provided for a skilled artisan to arrive at all of the embodiments of the subject invention.

Preparation and design of
ligand halves of the dimeric small molecule

10 A ligand half should bind its receptor with high affinity (≤ 100 nM), cross cell membranes yet be inert to modification or degradation, be available in reasonable quantities, and present a convenient side-chain for routine chemical derivatization that does not disrupt receptor binding.

15

A commercial source of traditional, non-covalent dimeric molecules for use in a chemically induced dimerization system is ARIAD (www.ariad.com), who call their CID "ARGENT TECHNOLOGY." The compounds described herein as well as other commercial
20 compounds can be derivatized for use in the bacterial three-hybrid system.

For example, methotrexate ("Mtx") is an attractive ligand half (also referred to as "chemical handle"). Mtx inhibition of
25 dihydrofolate reductase (DHFR) is one of the textbook examples of high-affinity ligand binding. The interaction between Mtx and DHFR is extremely well characterized in the literature both biochemically and structurally. DHFR is a monomeric protein and binds Mtx with picomolar affinity (11). Even though Mtx
30 inhibits DHFR with such high affinity, *E. coli* grows in the presence of Mtx when supplemented with appropriate nutrients (12). The ability of Mtx to serve both as an antibacterial and

an anticancer agent is clear evidence that Mtx has excellent pharmacokinetic properties. Mtx is known to be imported into cells via a specific folate transporter protein. Mtx is commercially available and can be synthesized readily from simple precursors. Mtx can be modified selectively at its γ -carboxylate without disrupting its interaction with DHFR (11, 13). Mtx is commercially available and can be modified selectively at its α -carboxylate without disrupting dihydrofolate reductase (DHFR) binding (11, 13). Even though Mtx inhibits DHFR with pM affinity (12), both *E. coli* and *S. cerevisiae* grow in the presence of Mtx when supplemented with appropriate nutrients (13).

However, not all ligand halves, also referred to as chemical handles, can be readily used in a given organism without the need to modify the organism. For instance, dexamethasone requires several heat-shock proteins ("HSPs"), in order to be bound by the glucocorticoid receptor ("GR"). The required HSPs occur in yeast and other eukaryotes; however, since bacteria lack these HSPs and thus GR fails to bind Dex, Dex based small molecules would not readily work in a bacterial three-hybrid system. Similarly, using Mtx in bacteria requires special adaptation of the bacterial cell as Mtx can actually act as an antibiotic, as discussed in more detail in the examples. Mtx is exported from the bacterial cell by the TolC-dependent multi-drug efflux pump (32). Knocking out the *tolC* gene allows Mtx-based molecules to not only enter the bacterial cell but remain there as well. Furthermore, knocking out *thyA* removed the toxic effects associated with Mtx by preventing the bio-accumulation of the toxic dihydrofolate substrate of DHFR (32). However, as discussed in detail in the example, knocking out the *thyA*, e.g.

-26-

through a mutation, is not primary at the concentrations of Mtx that is used in the described bacterial three-hybrid system. While to use Mtx in the exemplified system, one must only knock out the *tolC* gene/protein in order to assure that Mtx-based molecules remain in the cell, it is clearly possible to also knock out *thyA* for higher concentrations of Mtx.

Other ligand halves may be, for example, steroids; enzyme inhibitors, such as Methotrexate used herein; drugs, such as FK506; hormones, such as the thyroid hormone 3,5,3'-triiodothyronine; ligands for nuclear receptors may be retinoic acids; general cofactors, such as Biotin; and antibiotics, such as Coumermycin (which can be used to induce protein dimerization according to Perlmutter et al., Nature 383, 178 (1996)).

One, or both, of the ligand halves may also be a moiety that is a substrate for an enzyme, i.e. a moiety that would not on its own bind to a protein, but would require an enzyme to assist bonding to a protein. In this way, the system can be made dependent on an enzyme, and would only operate when an enzyme is present. Such an enzyme would form a covalent bond between the small non-peptide molecule and a protein. This would provide flexibility in the system by allowing for one of the non-covalent interactions to be replaced by a covalent interaction.

Similarly, one, or both, of the ligand halves may be a moiety that spontaneously seeks out and forms a covalent bond with a receptor. An example of this is the interaction between Fluorouracil and Thymidylate Synthase, and another between Cephalexin and the Penicillin Binding Protein. This would also provide flexibility in the system by allowing for one of the

-27-

non-covalent interactions replaced by a covalent interaction.

Linkage of the ligand halves in the dimeric small molecule

5 While the ligand halves can be simply linked by a covalent bond between the two of them, more elaborate linkages may also be used depending on the screen to be performed. The linkage may be formed by any of the methods known in the art (14,15). Descriptions of linkage chemistries are also provided by WO
10 94/18317, WO 95/02684, WO 96/13613, WO96/06097, and WO 01/53355, these references being incorporated herein by reference. The linkers are all commercially available or can be prepared in a single step. The linkers vary in hydrophobicity, length, and flexibility.

15 The linker may be designed to respond to enzymatic activity. For example, a linker can contain a glycosidase bond, which may be cleaved by a glycosidase enzyme and formed by a Glycosyltransferase enzyme; or an amide bond, which may be cleaved by a protease and formed by peptidase or transpeptidase;
20 or an aldol product bond, which is cleaved by a retro-aldolase and formed by aldolase; or an ester bond; or a phosphodiester bond. Such bonds can be used in bacterial based screens similarly to their use in yeast based screens, which are described in WO 01/53355.

25

The enzymes that act on such linkers may be known enzymes or novel proteins which are being screened for specific enzymatic activity. Novel enzymes can be evolved using combinatorial techniques.

30

Once a desired substrate is selected and formed into the dimeric

-28-

small molecule, a large number of enzymes and derivatives of enzymes can be screened. A variety of enzymes and enzyme classes are listed on the World Wide Web beginning at prowl.rockefeller.edu/enzymes/enzymes.htm. All enzymes are given an Enzyme Commission (E.C.) number allowing it to be uniquely identified. E.C. numbers have four fields separated by periods, "a.b.c.d". The left-hand-most field represents the most broad classification for the enzyme. The next field represents a finer division of that broad category. The third field adds more detailed information and the fourth field defines the specific enzyme. Thus, in the "a" field the classifications are oxidoreductases, transferases, hydrolases, lyases, isomerases, and ligases. Each of these "a" classifications are then further separated into corresponding "b" classification, each of which in turn is separated into corresponding "c" classifications, which are then further separated into corresponding "d" classes.

Moreover, new enzymes are discovered and are intended to be included within the scope of this invention, which is itself designed to evolve or discover such new enzymes.

Design of the protein chimeras

The second important feature is the design of the protein chimeras. A number of chimeras are discussed in detail in WO 01/53355.

The described bacterial three-hybrid system is based on the RNA polymerase two-hybrid system reported by Dove and Hochschild in 1997 (16). A variety of methods for detecting protein-protein interactions in bacteria are now available. (8-10, 16-19).

-29-

Generally, these methods based either on enzyme complementation or transcriptional activation or repression assays. While the enzyme complementation assays are essentially the same as those used in eukaryotes, entirely new transcription-based assays had to be developed for bacteria because the components of the transcription machinery are poorly conserved between eukaryotes and prokaryotes. The choice to adapt the RNA polymerase assay developed by Dove and Hochschild was because transcriptional activation in this assay results in a large increase in reporter gene transcription and because reconstitution of transcriptional activation was expected to be largely conformation independent. Based on their studies of the mechanism of transcriptional activation by λ -repressor (λ CI) (20), Dove and Hochschild developed an *in vivo* assay for protein-protein interactions based on dimerization of λ CI and the N-terminal domain of the α -subunit of RNA polymerase (α NTD). Specifically, they designed a reporter construct consisting of a λ CI operator upstream of the TATA box for the *lacZ* gene, which encodes β -galactosidase. They then prepared plasmids encoding a Gal4- λ CI fusion protein and a Gal11^P- α NTD fusion protein. Gal4 and Gal11^P are two proteins known to interact with high affinity and so provided a well-established test case. Finally, the interaction between Gal4- λ CI and Gal11^P- α NTD was shown to activate transcription of the *lacZ* reporter gene (21). This original Gal4-Gal11^P two-hybrid system is used as a small-molecule independent positive control in the example provided below.

Design of reporter genes

30 A reporter gene assay measures the activity of a gene's

-30-

promoter. It takes advantage of molecular biology techniques, which allow one to put heterologous genes under the control of a bacterial cell. Activation of the promoter induces the reporter gene as well as or instead of the endogenous gene. By design, the reporter gene codes for a protein that can easily be detected and measured. Commonly it is an enzyme that converts a commercially available substrate into a product. This conversion is conveniently followed by either chromatography or direct optical measurement and allows for the quantification of the amount of enzyme produced.

Reporter genes are commercially available on a variety of plasmids for the study of gene regulation in a large variety of organisms (22). Promoters of interest can be inserted into multiple cloning sites provided for this purpose in front of the reporter gene on the plasmid (23, 24). Standard techniques are used to introduce these genes into a cell type or whole organism (e.g., as described in Sambrook, J., Fritsch, E.F. and Maniatis, T. Expression of cloned genes in cultured mammalian cells. In: *Molecular Cloning*, edited by Nolan, C. New York: Cold Spring Harbor Laboratory Press, 1989). Resistance markers provided on the plasmid can then be used to select for successfully transfected cells.

Ease of use and the large signal amplification make this technique increasingly popular in the study of gene regulation. Every step in the cascade DNA --> RNA --> Enzyme --> Product --> Signal amplifies the next one in the sequence. The further down in the cascade one measures, the more signal one obtains.

In an ideal reporter gene assay, the reporter gene under the

-31-

control of the promoter of i.....st is transfected into cells, either transiently or stably. Receptor activation leads to a change in enzyme levels via transcriptional and translational events. The amount of enzyme present can be measured via its enzymatic action on a substrate.

Reconstitution of enzyme activity

In lieu of the protein chimeras or reporter genes as described above, the reassembly of an enzyme, and thus its activity, can be used as a reporter system. Complementation between enzyme fragments has been observed in numerous cases since the pioneering discovery of intracistronic complementation by Ullmann and colleagues in 1967. The so-called α -complementation between two truncated β -galactosidase polypeptides became a classical tool in molecular biology for cloning techniques and has recently found new interest in cell biology as a sensitive marker of eukaryotic cell fusions and a reporter.

Potentially, a large number of enzymes might be split into two complementary fragments that could reassociate to reconstitute the native enzymatic activity. Functional complementation between two enzyme fragments can be exploited to design a three-hybrid system provided that: (i) the cognate enzymatic activity is easily detected or selected for *in vivo*; (ii) the two fragments do not reassociate spontaneously when expressed as separate entities (as do, for example, the classical LacZ- α and α -acceptor); (iii) when fused to interacting polypeptides, the two fragments reassociate in an enzymatically active complex. A variety of enzyme reassembly systems have been described (37). For example, a protein complementation assay based on engineered

-32-

fragments of mouse dihydrofolate reductase (mDHFR) has been described (38). Subsequently, the same group used the mDHFR complementation assay to select pairs of leucine zippers that selectively heterodimerize.

5

One advantage of an enzyme reconstitution assay is that it can work in cells which do not endogenously express the enzyme, thus providing an efficient reporter system.

10 This invention will be better understood from the Experimental Details which follow. However, one skilled in the art will readily appreciate that the specific methods and results discussed are merely illustrative of the invention as described more fully in the claims which follow thereafter.

15

EXPERIMENTAL DETAILS

Part I - Preparation of dimeric small molecule ligand

In order to convert the Dove and Hoschild two-hybrid assay into a three-hybrid system, it was initially important to design a dimeric ligand that could bridge λ CI and α NTD via the ligand's receptors. For the bridging small molecule, a heterodimer of methotrexate (Mtx) and a synthetic analog of FK506 (SLF) was prepared. This heterodimer is referred to in this description as Mtx-SLF. Mtx-SLF was used to dimerize a λ CI-FK506 binding protein 12 (λ CI-FKBP12) protein chimera and an α NTD-dihydrofolate reductase (α NTD-DHFR) protein chimera as shown in Figure 1. Methotrexate (Mtx) inhibits dihydrofolate reductase (DHFR) with a low picomolar K_i , and the interaction between the two has been extensively studied (11, 25). In addition, our laboratory recently showed Mtx could be used successfully in a yeast three-hybrid system (7, 26). For the other half of the bridging small molecule, we used SLF, available from Ariad Pharmaceuticals as an FK506 analog. SLF has nanomolar affinity for FKBP12, and the interaction between the two has been fully characterized (27,28). In addition, SLF homodimers have been used previously in several mammalian three-hybrid systems (29).

The retrosynthetic analysis of Mtx-SLF is shown in Figure 2. The synthesis is based on previous syntheses of Mtx and SLF derivatives and was designed to allow Mtx, SLF, or the linker between them to be varied readily. The Mtx portion of the molecule begins as the γ -methyl ester of L-glutamic acid and is based on previous syntheses of Mtx (7,26,30). γ -Methyl L-glutamic acid is inexpensive, and the α -carboxylate can be

-35-

the Columbia University Chemistry Department NMR Facility. Spectra were determined in methanol- d_4 at 300 K with the proton or carbon (3.30 δ ; 49.0 δ) as the reference or in chloroform- d at 300K with proton (7.26 δ) as the reference. ^1H NMR spectra are tabulated in the following order: chemical shift calculated with reference to solvent standards based on tetramethylsilane, multiplicity (s, singlet; d, doublet; t, triplet; m, multiplet; br, broad), coupling constant(s) in Hertz, and number of protons. ^{13}C NMR spectra were determined on the Bruker 300 MHz instrument and are proton decoupled. Mass spectra (MS) were recorded at the Columbia University Department of Chemistry mass spectral laboratory. Fast Atom Bombardment (FAB) high resolution mass spectra (HRMS) were recorded on a JMS-HX110A mass spectrometer. Low resolution electron spray ionization mass spectra (LRMS) were recorded on a JMS-LC Mate mass spectrometer. Analytical thin layer chromatography (TLC) was performed on silica gel (Whatman LHPKF Silica Gel 60 \AA) and visualized by UV light (254 nm) or stained by ninhydrin. All column chromatography was flash chromatography carried out on silica gel (EM Science Silica Gel 60), and all eluants used are reported in volume:volume ratios. All moisture-sensitive reactions were performed under a positive pressure of nitrogen in flame- or oven-dried glassware. Organic extracts were dried over anhydrous sodium sulfate. Organic solvents were removed in vacuo with a rotary evaporator equipped with a vacuum pump (ca. 1 torr). Products were then left under vacuum (ca. 0.1 torr) overnight before analysis was performed.

-34-

selectively protected as the t -butyl ester by transiently protonating the α -amino group (31). The diprotected amino acid is then coupled to 4-(methylamino)benzoic acid using standard peptide coupling reagents. Finally, the γ -methyl ester is saponified to yield the free acid for further reactions. SLF acid was synthesized as described previously from L-pipecolinic acid in 59% yield for 6 steps (6,27). The Mtx and SLF portions were then coupled to 1,10-diaminodecane in a three-component peptide coupling reaction. 2,4-Diamino-6-bromomethyl-pteridine is added after this coupling reaction in order to simplify purification of the synthetic intermediates. Finally, acid cleavage of the t -butyl ester yielded Mtx-SLF. Thus, the Mtx-SLF heterodimer was prepared from two components in 5% overall yield for the 6 steps from the γ -methyl ester of L-glutamic acid or 6% overall yield in 9 steps from the L-pipecolinic acid precursor of SLF.

The synthetic chemistry performed for the preparation of the Mtx-SLF is described below.

Synthetic Chemistry

General Methods. Reagents were obtained from commercial suppliers and were used without further purification. All reagents for chemical synthesis were purchased from Aldrich. Anhydrous *N,N*-dimethylformamide and anhydrous methylene chloride were from Sure Seal™ bottles purchased from Aldrich. Methotrexate was a generous gift from the National Cancer Institute. Nuclear magnetic resonance (NMR) spectra were recorded on a Bruker 500 (500 MHz), a Bruker 400 (400 MHz) or a Bruker 300 (300 MHz) Fourier Transform (FT) NMR spectrometer at

-36-

Scheme I

Synthesis of 2. (31) The γ -methyl ester of L-glutamic acid (1) (5.02 g, 31.0 mmol) was added to a solution of 70% aqueous (aq.) perchloric acid (3.0 mL) in tert-butyl acetate (200 mL). The resulting solution was stirred at room temperature (rt) for 3 h during which time the acid dissolves completely. The reaction was then judged complete by thin layer chromatography (TLC) using 10:1 methylene chloride (CH_2Cl_2):methanol (MeOH). The reaction mixture was extracted with 0.5 N aq. HCl (4x, 400 mL). The pH of the combined aqueous layers was adjusted to 8 using saturated aq. sodium carbonate. The aqueous solution was then extracted with ethyl acetate (EtOAc) (4x, 500 mL). The organic extracts were combined, washed with brine (2x, 300 mL), and dried over anhydrous sodium sulfate. Removing the solvent in vacuo gave 2 as a clear oil in 65% yield: $R_f = 0.45$ in 10:1 CH_2Cl_2 :MeOH; $^1\text{H NMR}$ (400 MHz, CD_3OD) δ 3.66 (s, 3), 3.33 (t, $J = 6.5$ Hz, 1), 2.41 (m, 2), 1.95 (m, 1), 1.86 (m, 1); LRMS, m/z 218.2 (MH^+), 219.2 (MH_2^+).

Synthesis of 3. (7,30) Compound 2 (2.19 g, 10.0 mmol), 1,3-

-37-

dicyclohexylcarbodiimide (DCC, 3.09 g, 15.0 mmol), 1-hydroxylbenzotriazole hydrate (HOBT, 2.43 g, 18.0 mmol), and N-methyl-para-benzoic acid (1.59 g, 10.5 mmol) were dissolved in anhydrous dimethyl formamide (DMF, 22 mL) under a nitrogen atmosphere. Diisopropylethylamine (DIEA, 0.1 mL, 0.5 mmol) was added to the solution, and the reaction mixture was stirred overnight (ON) at rt. After 16 hr, a 1:2:1 water:saturated aq. sodium bicarbonate:brine solution (500 mL) was added to the reaction giving a yellow suspension. This solution was then extracted with EtOAc (4x, 300mL). The fractions were combined, washed with brine (2x, 200mL) and dried over anhydrous sodium sulfate. The organic solvent was then removed in vacuo. The product is purified by silica gel column chromatography (2:1 to 1:1 hexanes:EtOAc) in 76% yield: R_f = 0.25 in 1:1 hexanes:EtOAc; ^1H NMR (500 MHz, CD_3OD) δ 7.66 (d, J = 7.0 Hz, 2), 6.58 (d, J = 7.0 Hz, 2), 4.59 (dd, J = 9.5, 5.0 Hz, 1), 3.65 (s, 3), 2.79 (s, 3), 2.47 (t, J = 7.5 Hz, 2), 2.23 (m, 1), 2.05 (m, 1), 1.46 (s, 9); ^{13}C NMR (300 MHz, CD_3OD) δ 175.1, 173.0, 170.6, 154.6, 130.2, 121.5, 111.9, 82.9, 54.3, 52.3, 31.4, 30.0, 28.3, 27.6; LRMS, m/z 351.2 (MH^+); HRMS, m/z 351.1930 (MH^+), calculated 351.1920.

Synthesis of 4. Compound 3 (500 mg, 1.43 mmol) was dissolved in methanol (20 mL). Lithium hydroxide monohydrate (120 mg, 2.86 mmol) was dissolved in water. Both solutions were chilled in a 0°C ice bath. The aqueous solution was added to the methanol solution all at once. The resulting solution was stirred at 0°C for 10 minutes and then allowed to warm to rt and stirred for an additional 80 minutes. Solvent is removed in vacuo until only a yellow gel remained with a volume about 1 mL. Water (20 mL) was added to the remaining reaction mixture. The solution was

-38-

acidified to pH = 2 with 1 N HCl (9 mL) and was immediately extracted with EtOAc (5x, 25 mL). The organic extracts were combined, washed with brine (2x, 20 mL), and dried over anhydrous sodium sulfate. The solvent was removed in vacuo to yield product 4 in 93% yield: R_f = 0.05 in 1:1 EtOAc:hexanes and 0.45 in 5:1 CH_2Cl_2 :MeOH; ^1H NMR (400 MHz, CD_3OD) δ 7.64 (d, J = 7.0 Hz, 2), 6.56 (d, J = 7.0 Hz, 2), 4.46 (dd, J = 9.0, 5.0 Hz, 1), 2.80 (s, 3), 2.44 (t, J = 7.5 Hz, 2), 2.23 (m, 1), 2.05 (m, 1), 1.47 (s, 9); ^{13}C NMR (300 MHz, CD_3OD) δ 178.4, 174.8, 172.3, 156.2, 130.7, 123.2, 113.6, 84.6, 57.0, 33.2, 31.8, 30.5, 29.1; LRMS, m/z 337.3 (MH^+); HRMS, m/z 337.1751 (MH^+), calculated 337.1763.

Scheme II

15 Synthesis of 7.(27) Synthesized as reported in quantitative

-39-

yield to give 7 as a yellow solid: $R_f = 0.40$ in 1:1 EtOAc:hexanes; ^1H NMR (300 MHz, CDCl_3) δ 9.86 (s, 1), 7.61-7.55 (m, 2), 7.40-7.34 (m, 2), 7.32 (d, $J = 4.5$ Hz, 1), 7.25-7.10 (m, 2), 6.91-6.85 (m, 2), 3.95 (s, 3), 3.93 (s, 3); LRMS, m/z 284.9 (MH $^+$).

Synthesis of 8.(27) Synthesized as reported in near quantitative yield based on mass as a white crystalline solid. (NMR revealed a small amount of non-hydrogenated starting material remains and is carried through to the next step. NMR integration is used to determine relative quantities of the two materials.): $R_f = 0.50$ in 1:1 EtOAc:hexanes; ^1H NMR (300 MHz, CDCl_3); δ 7.55-7.48 (m, 2), 7.35 (t, $J = 8.0$ Hz, 1), 7.25 (t, $J = 8.5$ Hz, 1), 7.10 (br d, $J = 8.0$ Hz, 1), 6.91-6.73 (m, 3), 3.90 (s, 3), 3.88 (s, 3), 3.24 (t, $J = 7.5$ Hz, 2), 2.99 (t, $J = 8.0$ Hz, 2); LRMS, m/z 287.0 (MH $^+$).

Synthesis of 9.(27) Synthesized as reported to give 9 as a clear oil in quantitative yield by mass: $R_f = 0.60$ in 1:1 EtOAc:hexanes; ^1H NMR (300 MHz, CDCl_3) δ 7.59 (br d, 8.0 Hz, 1), 7.49 (m, 1), 7.37 (t, $J = 8.0$ Hz, 1), 7.14 (dd, $J = 8.0, 2.5$ Hz, 1), 6.85-6.72 (m, 3), 4.60 (s, 2), 3.89 (s, 3), 3.86 (s, 3), 3.27 (t, $J = 7.1$ Hz, 2), 3.04 (t, $J = 7.5$ Hz, 2), 1.50 (s, 9).

Synthesis of 10.(27) Synthesized as reported to yield product 10 in 20% yield fully purified. However, a 75% yield of unreacted starting material was also recovered. $R_f = 0.40$ in 5:1 CH_2Cl_2 :MeOH and 0.40 in 1:1 EtOAc:hexanes; ^1H NMR (500 MHz, CD_3OD) δ 7.28 (t, $J = 8.0$ Hz, 1), 6.93 (d, $J = 7.5$ Hz, 1), 6.89 (s, 1), 6.82 (d, $J = 8.0$ Hz, 1), 6.80-6.74 (m, 2), 6.70 (d, $J = 8.0$ Hz, 1), 4.60-4.53 (m, 3), 3.80 (s, 3), 3.78 (s, 3), 2.65-

-40-

2.51 (m, 2), 2.04-1.89 (m, 2), ... (s, 9); LRMS, m/z 403.3 (MH^+).

Scheme III

- 5 Synthesis of 12.(28) Synthesized as reported to give 12 as a white crystalline solid in quantitative yield based on NMR integration: 1H NMR (400 MHz, CD_3OD) δ 4.03 (br d, $J = 9.5$ Hz, 1), 3.83 (s, 3), 3.41 (br d, $J = 12.0$ Hz, 1), 3.04 (br t, $J = 11.0$ Hz, 1), 2.27 (br d, $J = 11.5$ Hz, 1), 2.00-1.63 (m, 5).

10

Synthesis of 13.(28) Synthesized as reported to yield 13 as a clear oil in 86% yield: $R_f = 0.70$ in 1:1 EtOAc:hexanes and 0.25 in 1:4 EtOAc:hexanes; 1H NMR (500 MHz, CD_3OD) δ 5.15 (br d, $J = 5.0$ Hz, 0.7), 4.62 (br d, $J = 4.0$ Hz, 0.3), 4.34 (br d, $J =$

-41-

12.0 Hz, 0.3), 3.89 (s, 2.1) (s, 0.9), 3.77 (s, 3), 3.57 (br d, $J = 14.0$ Hz, 0.7), 3.35 (m, 0.7), 2.91 (br t, $J = 13.0$ Hz, 0.3), 2.35-2.24 (m, 1), 1.83-1.65 (m, 3) 1.55-1.35 (m, 2)
This product exists as a 2.5:1 mixture of the *trans* and *cis*
5 conformations. Further analysis by COSY allows us to make the following assignments of the two peaks for each proton in the structure: 5.15 and 4.62, 4.34 and 3.57, 3.89 and 3.84, 3.35 and 2.91; LRMS, m/z 230.1 (MH_1^+).

10 **Synthesis of 14.(28)** Synthesized as reported to give 14 as a clear oil in 81% yield: $R_f = 0.85$ in 1:1 EtOAc:hexanes and 0.50 in 1:4 EtOAc:hexanes; 1H NMR (500 MHz, CD_3OD) δ 5.16 (br d, $J = 5.5$ Hz, 0.8), 4.38 (br d, $J = 11.5$ Hz, 0.2), 4.24 (br d, $J = 5.0$ Hz, 0.2), 3.75 (s, 3), 3.39 (br d, $J = 13.0$ Hz, 0.8), 3.23 (td,
15 $J = 13.0, 2.8$ Hz, 0.8), 2.91 (br t, $J = 13.0$ Hz, 0.2), 2.30 (br d, $J = 14.0$ Hz, 0.8), 2.22 (br d, $J = 13.5, 0.2$), 1.79-1.60 (m, 5) 1.55-1.35 (m, 2), 1.23-1.13 (m, 6), 0.86 (t, $J = 7.5$ Hz, 3)
This product exists as a 4:1 mixture of the *trans* and *cis* conformations. Further analysis by COSY allows us to make the
20 following assignments of the two peaks for each proton in the structure: 5.16 and 4.24, 4.38 and 3.39, 3.23 and 2.91, 2.30 and 2.22; LRMS, m/z 270.2 (MH^+).

Synthesis of 15.(28) Synthesized as reported to give the
25 product 15 as a white crystalline material in 96% yield: $R_f = 0.05$ in 1:1 EtOAc:hexanes; 1H NMR (500 MHz, $CDCl_3$) δ 5.29 (br d, $J = 5.5$ Hz, 0.8), 4.50 (br d, $J = 14.0$ Hz, 0.2), 4.26 (br d, $J = 4.5$ Hz, 0.2), 3.43 (br d, $J = 13.0$ Hz, 0.8), 3.24 (td, $J = 12.5, 3.5$ Hz, 0.8), 2.94 (br td, $J = 13.0, 3$ Hz, 0.2), 2.34 (br
30 d, $J = 12.0$ Hz, 0.8), 2.24 (br d, $J = 13.5, 0.2$), 1.79-1.60 (m, 5) 1.55-1.35 (m, 2), 1.23-1.13 (m, 6), 0.86 (t, $J = 7.5$ Hz, 3)

-42-

This product exists as a 4:1 mixture of the *trans* and *cis* conformations. Further analysis by COSY allows us to make the following assignments of the two peaks for each proton in the structure: 5.29 and 4.24, 4.50 and 3.43, 3.24 and 2.94, 2.34 and 2.24. Compounds 16, 17, 18, and MtX-SLF all have this same 4:1 conformation pattern and appear nearly the same spectroscopically as compound 15 for these peaks. For simplicity's sake the 0.8 integration will be called 1 and the 0.2 peak will be disregarded in the characterization for the rest of these compounds.

Scheme IV

Synthesis of 16. (27) Synthesized as reported to give 16 as a colorless oil in 88% yield: $R_f = 0.15$ in 4:1 hexanes:EtOAc and

-43-

0.65 in 1:1 EtOAc:hexanes; ¹H NMR (500 MHz, CD₃OD) δ 7.28 (t, J = 8.0 Hz, 1), 6.96 (m, 1), 6.89 (s, 1), 6.85 (m, 2), 6.78 (s, 1), 6.71 (d, J = 8.0 Hz, 1), 5.73 (m, 1), 5.21 (br d, J = 5.5 Hz, 1), 4.58 (s, 2), 3.80 (s, 3), 3.78 (s, 3), 3.38 (br d, J = 14.5 Hz, 1), 3.17 (td, J = 13.0, 3.0 Hz, 1), 2.65-2.52 (m, 2), 2.32 (br d, J = 13.0 Hz, 1), 2.30-2.20 (m, 1), 2.05 (p, J = 7.0 Hz, 1), 1.78-1.58 (m, 5), 1.46 (s, 9), 1.41-1.26 (m, 2), 1.23 (s, 3), 1.21 (s, 3), 0.86 (t, J = 7.5 Hz, 3) (see note in Compound 15); LRMS, m/z 640.7 (MH⁺).

10

Synthesis of 17.(27) Synthesized as reported to give 17 in quantitative yield. TLC analysis showed only one product and the acid was used without further purification: R_f = 0.05 in 1:1 EtOAc:hexanes and 0.35 in 10:1 CH₂Cl₂:MeOH.

15

Scheme V

Synthesis of 18. Compound 4 (42.7 mg, 0.127 mmol), compound 17 (74.1 mg, 0.127 mmol), 1,10-diaminodecane (20.7 mg, 0.120 mmol),

-44-

DCC (130 mg, 0.631 mmol), and CH_2Cl_2 (30.0 mg, 0.246 mmol) were dissolved in CH_2Cl_2 (3 mL) under a nitrogen atmosphere and stirred at rt overnight. After 16 hours, the solvent was removed in vacuo. The product was purified by silica gel column chromatography (1:4 EtOAc:hexanes to pure EtOAc) to give a white solid in 30% yield: $R_f = 0.65$ in EtOAc and 0.60 in 10:1 CH_2Cl_2 :MeOH; ^1H NMR (500 MHz, CD_3OD) δ 7.64 (d, $J = 7.0$ Hz, 2), 7.28 (td, $J = 8.0, 3.0$ Hz, 1), 6.98 (m, 2), 6.91 (d, $J = 7.5$ Hz, 1), 6.85 (d, $J = 8.0$ Hz, 1), 6.76 (s, 1), 6.69 (d, $J = 8.0$ Hz, 1), 6.56 (d, $J = 7.0$ Hz, 2), 5.74 (m, 1), 5.21 (br d, $J = 5.0$ Hz, 1), 4.51 (s, 2), 4.46 (m, 1), 3.80 (s, 3), 3.78 (s, 3), 3.38 (br d, $J = 12.5$ Hz, 1), 3.23 (t, $J = 7.0$ Hz, 2), 3.17 (td, $J = 13.0, 3.0$ Hz, 1), 3.11 (t, $J = 7.0$ Hz, 2), 2.80 (s, 3), 2.65-2.52 (m, 2), 2.37-2.30 (m, 3), 2.30-2.15 (m, 2), 2.10-2.00 (m, 2), 1.78-1.58 (m, 4), 1.48 (s, 9), 1.54-1.38 (m, 5), 1.38-1.28 (m, 2), 1.28-1.16 (m, 18), 0.86 (t, $J = 7.5$ Hz, 3) (see note in Compound 15).

Synthesis of Mtx-SLF. (7,26,30) Compound 18 (40.0 mg, 38.0 μmol) and the hydrobromide salt of 2,4-diamino-6-bromomethyl pteridine (18 mg, 45 μmol) were dissolved in N, N' -dimethyl acetamide (2 mL). The reaction mixture was stirred in a 50°C oil bath for 12 hours. The intermediate product ($R_f = 0.50$ in 10:1 CH_2Cl_2 :MeOH) was purified by silica gel column chromatography (30:1 to 10:1 CH_2Cl_2 :MeOH). The crude product was dissolved in trifluoroacetic acid (3 mL) at 0°C for 5 minutes and allowed to warm to rt and stirred at rt for 1 hour. Toluene (3x, 50 mL) was added to the reaction mixture, and all solvent was removed in vacuo. After removal of solvents, Mtx-SLF was purified by preparative thin layer silica gel chromatography (5:1 CH_2Cl_2 :MeOH, 4x) to give a yellow solid in 33% yield (for two steps): $R_f = 0.15$ in 3:1

-45-

CH₂Cl₂:MeOH; ¹H NMR (500 MHz, ---, ---, δ 8.55 (s, 1), 7.73 (d, J = 8.0 Hz, 2), 7.28 (t, J = 7.5 Hz, 1), 6.98 (m, 2), 6.91 (br d, J = 7.5 Hz, 1), 6.85-6.79 (m, 3), 6.76 (s, 1), 6.69 (d, J = 6.5 Hz, 1), 5.73 (m, 1), 5.21 (br s, 1), 4.75 (s, 2), 4.50 (s, 2), 4.46 (m, 1), 3.80 (s, 3), 3.78 (s, 3), 3.38 (br d, J = 13.0 Hz, 1), 3.25-3.10 (m, 6), 3.05 (t, J = 7.0 Hz, 2), 2.65-2.52 (m, 2), 2.37-2.15 (m, 5), 2.10-2.00 (m, 2), 1.78-1.58 (m, 4), 1.50-1.42 (m, 3), 1.38-1.32 (m, 3), 1.35-1.25 (m, 4), 1.25-1.16 (m, 15), 0.86 (t, J = 7.5 Hz, 3) (see note in Compound 15).

Small molecule concentration calibration. The small molecules were dissolved in DMF to concentrations of 10 mM for Mtx and 12 mM for the Mtx-SLF molecule. The concentrations of Mtx and Mtx-SLF were determined by Beer's law using an extinction coefficient of $\epsilon = 6700 \text{ cm}^{-1}\text{M}^{-1}$ (calculated from a known solution of Mtx in DMF) for Mtx-SLF. Solutions of compound 16 (SLF-OtBu) were prepared on a sufficient scale to mass 16 accurately. All small molecules were stored under a nitrogen atmosphere at -80°C and allowed to come to rt before use.

Part II - Construction fo E.coli strain.

The next step was the construction of the E. coli strain expressing the λ cI-FKBP12 and α NTD-DHFR fusion proteins and containing the lacZ reporter construct. Plasmids encoding the λ cI-FKBP12 and α NTD-DHFR chimeras were prepared from vectors pAC λ cI32 and pBR α LN using standard molecular biology techniques (8). The same synthetic lacZ reporter, placOR2-62, as initially reported by the Hochschild lab was used. The reporter placOR2-62 is maintained in one copy in the chromosome as a prophage and encodes the lacZ gene 62 bp downstream from the λ cI operator

-46-

(Figure 1) (16). Based on pre. results from Kopytek and Hu showing that *tolC*⁻ and *thyA*⁻ mutations improved the viability and tolerance of *E. coli* to Mtx-based molecules, we expected export as well as toxicity of Mtx-SLF to be problematic in *E. coli* (32). Thus, we modified the original Hochschild strain KS1 to be *tolC*⁻ in order to decrease active export of our small molecule. At the low concentrations of Mtx-SLF required for the three-hybrid experiments, however, Mtx was not sufficiently toxic to warrant the *thyA*⁻ mutation. We introduced the *tolC*⁻ mutation into KS1 via a Plvir transduction from strain SK037 (32). We call this test strain V674E. Transformation of the plasmids bearing the various λ cI and α NTD fusion proteins into V674E yielded the final experimental strains.

The molecular biology performed for the preparation of the strain is described below.

General methods. Restriction enzymes, Vent DNA polymerase and T4 DNA ligase were purchased from New England Biolabs. The dNTPs used in the Polymerase Chain Reaction (PCR) were purchased from Pharmacia Biotech. Oligonucleotides were purchased from The Great American Gene Company (www.geneco.com). The bacto-agar, tryptone-peptone and bacto-yeast extract were purchased from DIFCO. Falcon 14 mL culture tubes were used for growing bacteria. Corning Costar 96-well plates with V-shaped wells used for growing the bacteria for solid media plate assays. The phrog used to transfer cells into 96-well plates or onto petri plates containing agar media was purchased from Dan-Kar Corp. (Wilmington, MA). 5-Bromo-4-chloro-3-indolyl- β -D-galactopyranoside (X-gal) for the plate assays was purchased from Diagnostic Chemicals (Oxford, CT). o-Nitrophenyl- β -D-

-47-

galactopyranoside (ONPG) for the liquid assays was purchased from Sigma. Methotrexate was from the National Cancer Institutes (NCI). All other chemicals were purchased from Aldrich or Sigma. All aqueous solutions were made with distilled water prepared from a Milli-Q Water Purification System. For Polymerase Chain Reaction (PCR), a MJ Research PTC-200 Peltier Thermal Cycler was employed. The transformation of *E. coli* was carried out by electroporation using a Bio-Rad *E. coli* Pulser. UV/Vis spectra and absorbances were taken using a Perkin-Elmer Lambda 6 Spectrophotometer. Restriction digests were carried out as recommended by New England Biolabs. Sequencing of the receptor domains of all plasmids constructed was performed by Gene Wiz (New York, NY). All other standard molecular biology techniques were carried out essentially as described (33-35).

The bacterial two-hybrid plasmids, pAC^λcI32, pBR^αLN, pACLGF2, and pBR^αGall1^P, and *E. coli* strain KS1 were obtained (8,21). Plvir and *E. coli* strain SK037 were obtained (32); and plasmid pJG-FKBP12 was obtained (2). Map of pBR^αLN with TEM1 follows.

Construction of λ CI-FKBP12 and λ CI-DHFR protein chimeras. The gene encoding dihydrofolate reductase (DHFR) from *E. coli* was subcloned from plasmid pMW102eDHFR to pBR α LN (7,26). A 531 bp NotI to BamHI fragment was prepared by polymerase chain reaction (PCR) from pMW102eDHFR (26) using the primers 5'-ACT TCA GGT GCG GCC GCA GGC TCG GGC GGC TCG GGC GGC GGA GTG CAG GTG GAA AC-3' (5' primer VWC482, flanked by a NotI site (underlined) and a Gly-Ser-Gly-Gly-Ser-Gly-Gly linker) and 5'-TGT ATC AAC GGA TCC TTA ATG GTG ATG GTG ATG GTG CGA GCC GAA TTC TTC CAG TTT TAG AA-3' (3' primer VWC487, flanked by a BamHI site (underlined) and a 6 His tag followed by a stop codon). This fragment was inserted between the NotI site and the BamHI site in pBR α LN to give to pBR α LNedHFR. The region generated by PCR was verified by DNA sequencing using primers VWC628, 5'-CTG GCT GAA CAA CTG GAA GC, and VWC629, 5'-ATA TAG GCG CCA GCA ACC GC.

The gene encoding FKBP12 was subcloned from plasmid pJG-FKBP12 to pAC λ CI32. A 384 bp Not I to Asc I fragment was prepared by polymerase chain reaction (PCR) from plasmid pJG-FKBP12 using the primers 5'-ACT TCA GGT GCG GCC GCA GGC TCG GGC GGC TCG GGC GGC GGA GTG CAG GTG GAA AC-3' (5' primer VWC611, flanked by a NotI site (underlined) and a Gly-Ser-Gly-Gly-Ser-Gly-Gly linker) and 5'-TGT ATC AAC GGC GCG CCT TAA TGG TGA TGG TGA TGG TGC GAG CCG AAT TCT TCC AGT TTT AGA A-3' (3' primer VWC612, flanked by a AscI site (underlined) and a 6 His tag followed by a stop codon). This fragment was inserted between the NotI site and the AscI site in plasmid pAC λ CI32 to give pAC λ CI FKBP12. The region amplified by PCR was verified by DNA sequencing using primers VWC626, 5'-CCC AAT GAT CCC ATG CAA TG, and VWC627, 5'-GCG CTT CGT TAA TAC AGA TG.

Construction of bacterial strains. (35,36) Strain V674E was made from KS1 via a Plvir transduction from SK037 essentially as described.⁽¹⁴⁾ Incubation times were increased to 30 minutes for infection and 60 minutes after addition of citrate in order to accommodate slower growing times for the mutated strain. The infected cells are then plated on LB plates containing 12 $\mu\text{g/mL}$ tetracycline and 20 mM sodium citrate and incubated at 37°C overnight. In addition, the positive transductants are verified by streak purification on an LB plate with 12 $\mu\text{g/mL}$ tetracycline, 100 $\mu\text{g/mL}$ kanamycin, and 20 mM sodium citrate to give strain V674E.

Electrocompetent cells of strain V674E were made by standard methods(35); however, the transformation efficiency of this strain is low (10^6 - 10^7) due to the *tolC*⁻ mutation. Using standard methods, both the pAC ^{λ} CI32 and the pBR ^{α} LN plasmids or appropriate derivatives were transformed into the strain. Transformants were grown on LB with 100 $\mu\text{g/mL}$ ampicillin and 6 $\mu\text{g/mL}$ chloramphenicol. Note: Chloramphenicol is also a substrate for *tolC* so levels above 8 $\mu\text{g/mL}$ significantly impair growth and viability of *tolC*⁻ strains. In addition MacConkey plates can't be used because MacConkey media is toxic to strains bearing a *tolC*⁻ mutation.

LacZ assays. (7,20,35) The bacterial strains were stored as 20% glycerol stocks in 96-well plates at -80°C. To do the plate assay, the bacterial strains were first phroged to LB liquid media containing 100 $\mu\text{g/mL}$ ampicillin and 6 $\mu\text{g/mL}$ chloramphenicol in a 96-well plate and then incubated in a 37 °C shaker overnight. These saturated cultures were used to inoculate a second 96-

-50-

well plate containing fresh liquid media with 100 µg/mL ampicillin, 6 µg/mL chloramphenicol, and 0.5 mM IPTG using the phrog. These cultures were grown at 37°C shaking at 240 rpm for 4-5 hours until the cultures were just beginning to be turbid. 5 These cultures were then phrogged to X-gal plates and X-gal plates with varying concentrations of Mtx-SLF and incubated at 37°C. The X-gal plates are LB solid media plates containing 40 µg/mL X-gal, 0.5 mM IPTG, 0.5 tPEG (a β-galactosidase inhibitor), 100 µg/mL ampicillin and 6 µg/mL chloramphenicol. X-gal 10 hydrolysis was first visible at about 8 hours and increased until about 18 hours of growth at which point it appeared to reach a maximum.

For the liquid assays, the strains were incubated overnight in 15 LB liquid media containing 100 µg/mL ampicillin, 6 µg/mL chloramphenicol, and 0.5 mM IPTG overnight. These cultures were used to inoculate 1000 fold into LB liquid media containing 100µg/mL ampicillin, 6µg/mL chloramphenicol, 0.5 mM IPTG, and small molecule (per concentration indicated in each experiment) 20 and grown to a final OD₆₀₀ of 0.4-0.6 in a 37°C shaker which took about 5 hours. No tPEG is used in the liquid assays in order to get a true quantization of the transcription. Then, the protocol from Miller was followed exactly using 0.1 mL cell lysate for the assay (35).

25

Part III - Screening

Using standard β-galactosidase assays on plates (35), we established that Mtx-SLF activates transcription of the lacZ reporter gene in *E. coli* strain V674E. For the plate assays, 30 mid-log phase liquid cultures of the strains were transferred to a luria broth (LB) plate containing Mtx-SLF, 5-bromo-4-chloro-3-

-51-

indolyl- β -D-galactoside (Δ -gal), isopropyl- β -D-thiogalactopyranoside (IPTG), phenylethyl- β -D-thiogalactoside (tPEG, a β -galactosidase inhibitor), and the appropriate antibiotics. The plates were then incubated for 18 hours at 37°C. The concentrations of Mtx-SLF were varied between 0.1 μ M and 10 μ M (not all shown). On plates containing Mtx-SLF, we observed a substantial increase in the levels of β -galactosidase synthesis over those due to basal transcription (Figure 3). Importantly, this increase is dependent on both DHFR and FKBP12 and correlates with the concentration of Mtx-SLF in the plate media. Also, it is interesting to note that at 10 μ M Mtx-SLF the levels of small-molecule induced transcription in the three-hybrid strain appears to be greater than those induced by the direct protein-protein interaction in the two-hybrid control.

These X-gal plate results were confirmed using more quantitative liquid β -galactosidase assays. The liquid assays were carried out essentially as originally described by Miller (35). Overnight cultures were used to inoculate fresh LB media containing Mtx-SLF, IPTG, and the appropriate antibiotics. These cultures were grown, lysed, and assayed for β -galactosidase activity using o-nitrophenyl- β -D-galactopyranoside (ONPG), a chromogenic substrate for β -galactosidase. We once again observed small-molecule dependent transcriptional activation (Figure 4). Cells expressing λ CI-FKBP12 and α NTD-DHFR showed 6-fold activation at 1 μ M and 10-fold activation at 10 μ M Mtx-SLF relative to cells expressing only λ CI and α NTD. For comparison, the levels of transcription in cells expressing λ CI-Gal4 and α NTD-Gal11^P are 13-fold those of cells with λ CI and α NTD and both are unaffected by the concentration of Mtx-SLF in the media. As

seen in Figure 5, the levels of transcriptional activation in the three-hybrid system correlate with the concentration of Mtx-SLF in the media. We begin to see transcriptional activation at 0.3 μ M Mtx-SLF, and the levels of activation are still increasing at 10 μ M Mtx-SLF. At higher concentrations, Mtx-SLF begins to be toxic to the *E. coli* cells. Interestingly, at 10 μ M Mtx-SLF, the levels of transcriptional activation in the three-hybrid strain approach those in the two-hybrid strain. We attribute this sensitivity to the picomolar affinity of the Mtx/DHFR interaction, although this interpretation has not been proven. Again several independent controls establish that transcriptional activation indeed requires both halves of Mtx-SLF (Figure 4). Neither Mtx, SLF, nor a combination of the two affects the levels of transcription in the three-hybrid system. At 1 μ M Mtx-SLF, a 10-fold excess of either Mtx or the tert-butyl ester of SLF decreased the levels of transcription to about half that with 1 μ M Mtx-SLF alone. Deletion of either DHFR or FKBP12 from the λ cI-FKBP12 and α NTD-DHFR fusion proteins drops the levels of small-molecule induced transcriptional activation to the background levels observed with only λ cI and α NTD.

DISCUSSION

The bacterial small-molecule three-hybrid system described here provides a robust platform for high-throughput assays based on protein-small-molecule interactions. The Mtx-SLF heterodimeric ligand can be prepared readily and gives a strong transcription readout in the *E. coli* RNA polymerase three-hybrid system. Notably, the levels of transcriptional activation with the Mtx-SLF three-hybrid system are comparable to those with the Gal4-Gall1^P interaction, despite the fact that one non-covalent interaction has been replaced with two. This result may speak

-53-

to the importance of the particularly high affinity between Mtx and DHFR.

By adapting bacteria to allow for the use of the Mtx/DHFR
5 interaction, the described three-hybrid system that uses
Mtx/DHFR is far superior to previous bacterial systems of any
type. For example, while it is a different system and designed
for different purpose, the system described in (9) provides a
context in which the described three-hybrid system based on
10 Mtx/DHFR can be analyzed. The concentrations of small molecule
in (9) vary between 50 and 350 μ M with 250 μ M being the first
concentrations at which activity is conclusive. The described
Mtx/DHFR system does not need higher than 10 μ M and results can
be detected absolutely at concentrations below 1 μ M. In
15 addition, the described Mtx/DHFR system shows a 10-fold increase
in signal upon addition of small molecules whereas in (9) shows
a signal to noise ratio of at most 1.25. In fact, the writers
of (9) admitted that screening a library would be very difficult
with their system, as shown by the fact that when screening a
20 library for activity, they obtain 6 false positives and only a
single true positive hit. In addition, the system described in
(9) requires several different fluorescent dyes in order to
maintain signal stability. Thus, the described bacterial
three-hybrid system using Mtx/DHFR is far superior for screening
25 libraries because of the far lower concentrations of small
molecule requirements due to much stronger interactions, as well
as a vastly improved signal to noise ratio.

Three-hybrid systems provide an *in vivo* alternative to affinity
30 chromatography that can be used to evolve proteins that
recognize a particular small molecule, to screen a library of

small molecules based on binding to a particular protein, or to screen cDNA libraries to find the protein targets of drugs or to classify proteins based on their small-molecule interactions. Because of the high transformation efficiency and rapid doubling time of *E. coli*, this system should increase the number of proteins that can be tested in three-hybrid assays by several orders of magnitude compared with yeast systems. A bacterial assay should be particularly advantageous in molecular evolution experiments where on the order of 10^8 variants may be necessary to alter protein function. Based on our results, we believe Mt x will provide a versatile anchor for presenting a variety of different small molecules.

The yeast three-hybrid assay provided a method for *in vivo* affinity chromatography that greatly simplifies protein identification and amplification at the end of affinity panning. The bacterial system described here should increase the number of protein variants that can be assayed by several orders of magnitude.

What is claimed is:

1. A transgenic bacterial cell comprising
 - (a) a dimeric small molecule which comprises a first moiety known to bind a first receptor domain covalently linked to a second moiety capable of binding a second receptor domain, wherein the first and second moieties are different;
 - (b) nucleotide sequences which upon transcription encode
 - i) a first fusion protein comprising the first receptor domain, and
 - ii) a second fusion protein comprising the second receptor domain; and
 - (c) a reporter gene wherein expression of the reporter gene is conditioned on the proximity of the first fusion protein to the second fusion protein.
2. The bacterial cell of claim 1, wherein the dimeric small molecule has the formula:
$$H1 - Y - H2$$
wherein each of H1 and H2 may be the same or different and capable of binding to a receptor which is the same or different with a IC_{50} of less than 100 μM ; and
wherein Y is a linker which may be present or absent.
3. The bacterial cell of claim 2, wherein H1 or H2 is capable of binding to a receptor with a IC_{50} of less than 10 μM .
4. The bacterial cell of claim 2, wherein H1 or H2 is capable of binding to a receptor with a IC_{50} of less than 1 μM .

12. The bacterial cell of claim 1, wherein the dimeric small molecule has the structure:

wherein n is an integer from 1 to 20.

13. The bacterial cell of claim 12, wherein n is an integer from 2 to 12.
14. The bacterial cell of claim 12, wherein n is an integer from 3 to 9.
15. The bacterial cell of claim 12, wherein n is 8.
16. The bacterial cell of claim 1, wherein the first fusion protein further comprises a DNA binding domain, and the second fusion protein further comprises a transcription activation domain.
17. The bacterial cell of claim 1, wherein the first fusion protein further comprises a transcription activation domain, and the second fusion protein further comprises a DNA binding domain.
18. The bacterial cell of claim 16 or 17, wherein the

5. The bacterial cell of claim 2, wherein H1 or H2 is capable of binding to a receptor with a IC_{50} of less than 100 nM.
6. The bacterial cell of claim 2, wherein H1 or H2 is capable of binding to a receptor with a IC_{50} of less than 10 nM.
7. The bacterial cell of claim 2, wherein H1 or H2 is capable of binding to a receptor with a IC_{50} of less than 1 nM.
8. The bacterial cell of claim 2, wherein H1 or H2 is a methotrexate moiety, FK506 moiety, an FK506 analog, a tetracycline moiety, or a cephem moiety.
9. The bacterial cell of claim 8, wherein H1 or H2 is a methotrexate moiety.
10. The bacterial cell of claim 8, wherein H1 or H2 is an FK506 analog.
11. The bacterial cell of claim 10, wherein the FK506 analog has the structure:

-62-

transcription activation .n is α NTD.

19. The bacterial cell of claim 16 or 17, wherein the DNA-binding domain is λ cI, AraC, LexA, Gal4, or zinc fingers.
20. The bacterial cell of claim 1, wherein the first or the second receptor domain is that of dihydrofolate reductase ("DHFR"), glucocorticoid receptor, FKBP12, FKBP mutants, tetracycline repressor, or a penicillin binding protein.
21. The bacterial cell of claim 20, wherein the DHFR is the *E.coli* DHFR ("eDHFR").
22. The bacterial cell of claim 1, wherein the first fusion protein is DHFR- λ cI or FKBP12- λ cI.
23. The bacterial cell of claim 1, wherein the second fusion protein is DHFR- α NTD or FKBP12- α NTD.
24. The bacterial cell of claim 1, wherein the reporter gene is *Lac Z*, *araBAD*, *aadA* (spectinomycin resistance), *his3*, β -lactamase, GFP, luciferase, Tet R (tetracyclin resistance), KanR (kanamycin resistance), Cm (chloramphenicol resistance).
25. The bacterial cell of claim 24, wherein the reporter gene is *Lac Z*.
26. A transgenic bacterial cell comprising
 - (a) a dimeric small molecule which comprises a methotrexate moiety covalently linked to a moiety capable of binding a

receptor domain;

(b) nucleotide sequences which upon transcription encode

i) a first fusion protein comprising a DHFR domain,
and

ii) a second fusion protein comprising the receptor
domain; and

(c) a reporter gene wherein expression of the reporter
gene is conditioned on the proximity of the first fusion
protein to the second fusion protein.

27. The bacterial cell of claim 26 wherein the moiety known to bind a receptor domain is capable of binding to a receptor with a IC_{50} of less than 100 nM.
28. The bacterial cell of claim 26, wherein the moiety known to bind a receptor domain is capable of binding to a receptor with a IC_{50} of less than 10 nM.
29. The bacterial cell of claim 26, wherein the moiety known to bind a receptor domain is capable of binding to a receptor with a IC_{50} of less than 1 nM.
30. A method for identifying a molecule that binds a known target receptor in a bacterial cell from a pool of candidate molecules, comprising:
 - (a) forming a dimeric molecule by covalently bonding each molecule in the pool of candidate molecules to a ligand capable of selectively binding to a receptor;
 - (b) introducing the dimeric molecule into a bacterial cell culture comprising bacterial cells that express a first fusion protein which comprises the known target receptor domain against which the candidate molecule is screened,

a second fusion protein v comprises the receptor domain to which the ligand selectively binds, and a reporter gene wherein expression of the reporter gene is conditioned on the proximity of the first fusion protein to the second fusion protein;

(c) permitting the dimeric molecule to bind to the first fusion protein and to the second fusion protein, bringing the two fusion proteins into proximity so as to activate the expression of the reporter gene;

(d) selecting the bacterial cell that expresses the reporter gene; and

(e) identifying the small molecule that binds the known target receptor.

31. The method of claim 30, wherein the steps (b)-(e) of the method are iteratively repeated in the presence of a preparation of random small molecules for competitive binding with the screening molecule so as to identify a molecule capable of competitively binding the known target receptor.
32. The method of claim 30, wherein the dimeric molecule is obtained from a combinatorial library.
33. The method of claim 30, wherein the dimeric molecule comprises a ligand capable of selectively binding to a receptor with a IC_{50} of less than 100 μM .
34. The method of claim 33, wherein the dimeric molecule comprises a ligand capable of selectively binding to a receptor with a IC_{50} of less than 100 nM.

-65-

35. The method of claim 3 wherein the dimeric molecule comprises a ligand capable of selectively binding to a receptor with a IC_{50} of less than 1 nM.
36. The method of claim 30, wherein the dimeric molecule comprises a methotrexate moiety, FK506 moiety, an FK506 analog, a tetracycline moiety, or a cephem moiety.
37. The method of claim 30, wherein the dimeric molecule comprises a methotrexate moiety.
38. The method of claim 30, wherein the dimeric molecule comprises an FK506 analog.
39. The method of claim 38, wherein the FK506 analog has the structure:

40. The method of claim 30, wherein the first fusion protein further comprises a DNA binding domain, and the second fusion protein further comprises a transcription activation domain.
41. The method of claim 30, wherein the first fusion protein further comprises a transcription activation domain, and the second fusion protein further comprises a DNA binding

domain.

42. The method of claim 40 or 41, wherein the transcription activation domain is α NTD.
43. The method of claim 40 or 41, wherein the DNA-binding domain is λ cI, AraC, LexA, Gal4, or zinc fingers.
44. The method of claim 30, wherein the first or the second fusion protein comprises a receptor domain of dihydrofolate reductase ("DHFR"), glucocorticoid receptor, FKBP12, FKBP mutants, tetracycline repressor, or a penicillin binding protein.
45. The method of claim 44, wherein the DHFR is the *E. coli* DHFR ("eDHFR").
46. The method of claim 30, wherein the first fusion protein is DHFR- λ cI or FKBP12- λ cI.
47. The method of claim 30, wherein the second fusion protein is DHFR- α NTD or FKBP12- α NTD.
48. The method of claim 30, wherein the reporter gene is *Lac Z*, araBAD, aadA, his3, β -lactamase, GFP, luciferase, TetR, KanR, Cm.
49. The method of claim 48, wherein the reporter gene is *Lac Z*.
50. A method for identifying an unknown target receptor to which a known molecule is capable of binding in a bacterial

-67-

cell, comprising:

(a) providing a dimeric molecule having a first ligand which has a specificity for the unknown target receptor covalently bonded to a second ligand capable of selectively binding to a receptor;

(b) introducing the dimeric molecule into a bacterial cell which expresses a first fusion protein which comprises the unknown target receptor domain, a second fusion protein which comprises the receptor domain to which the second ligand selectively binds, and a reporter gene wherein expression of the reporter gene is conditioned on the proximity of the first fusion protein to the second fusion protein;

(c) permitting the dimeric molecule to bind to the first fusion protein and to the second fusion protein so as to activate the expression of the reporter gene;

(d) selecting which bacterial cell expresses the unknown target receptor; and

(e) identifying the unknown target receptor.

51. The method of claim 50, wherein the unknown target receptor is encoded by a DNA from the group consisting of genomicDNA, cDNA and syntheticDNA.
52. The method of claim 50, wherein the steps (b)-(e) of the method are iteratively repeated so as to identify the unknown target receptor.
53. The method of claim 50, wherein the dimeric molecule comprises a ligand capable of selectively binding to a receptor with a IC_{50} of less than 100 μM .

-68-

54. The method of claim 5, wherein the dimeric molecule comprises a ligand capable of selectively binding to a receptor with a IC_{50} of less than 100 nM.
55. The method of claim 50, wherein the dimeric molecule comprises a ligand capable of selectively binding to a receptor with a IC_{50} of less than 1 nM.
56. The method of claim 50, wherein the dimeric molecule comprises a methotrexate moiety, FK506 moiety, an FK506 analog, a tetracycline moiety, or a cephem moiety.
57. The method of claim 50, wherein the dimeric molecule comprises a methotrexate moiety.
58. The method of claim 50, wherein the dimeric molecule comprises an FK506 analog.
59. The method of claim 58, wherein the FK506 analog has the structure:

60. The method of claim 50, wherein the first fusion protein further comprises a DNA binding domain, and the second fusion protein further comprises a transcription activation domain.

61. The method of claim 50, wherein the first fusion protein further comprises a transcription activation domain, and the second fusion protein further comprises a DNA binding domain.
62. The method of claim 60 or 61, wherein the transcription activation domain is α NTD.
63. The method of claim 60 or 61, wherein the DNA-binding domain is λ cI, AraC, LexA, Gal4, or zinc fingers.
64. The method of claim 50, wherein the first or the second fusion protein comprises a receptor domain of dihydrofolate reductase ("DHFR"), glucocorticoid receptor, FKBP12, FKBP mutants, tetracycline repressor, or a penicillin binding protein.
65. The method of claim 64, wherein the DHFR is the *E.coli* DHFR ("eDHFR").
66. The method of claim 50, wherein the first fusion protein is DHFR- λ cI or FKBP12- λ cI.
67. The method of claim 50, wherein the second fusion protein is DHFR- α NTD or FKBP12- α NTD.
68. The method of claim 50, wherein the reporter gene is *Lac Z*, *araBAD*, *aadA*, *his3*, β -lactamase, GFP, luciferase, TetR, KanR, Cm.

69. The method of claim 68, wherein the reporter gene is *Lac Z*.
70. A kit for identifying a molecule that binds to a known target in a bacterial cell from a pool of candidate molecules, comprising
- (a) a host bacterial cell containing a reporter gene that is expressed only when bound to a DNA-binding domain and when in the proximity of a transcription activation domain;
 - (b) a first vector containing a promoter that functions in the host bacterial cell and a DNA encoding a DNA-binding domain;
 - (c) a second vector containing a promoter that functions in the host bacterial cell and a DNA encoding a transcription activation domain;
 - (d) a dimeric small molecule which comprises a moiety that binds to a known receptor domain covalently linked to a candidate molecule;
 - (e) a means for inserting into the first vector or the second vector a DNA encoding the known receptor domain in such a manner that the known receptor domain and an expression product of the first or second vector are expressed as a fusion protein;
 - (f) a means for inserting into the first vector or the second vector a DNA encoding the known target receptor in such a manner that the known target receptor and an expression product of the first or second vector are expressed as a fusion protein; and
 - (g) a means for transfecting the host cell with the first vector, and the second vector, wherein binding of the dimeric small molecule to the known target receptor results in a measurably greater expression of the reporter gene than in the absence of such binding.

71. A kit for identifying a known target receptor to which a molecule is capable of binding in a bacterial cell, comprising
- (a) a host bacterial cell containing a reporter gene that is expressed only when bound to a DNA-binding domain and when in the proximity of a transcription activation domain ;
 - (b) a first vector containing a promoter that functions in the host bacterial cell and a DNA encoding a DNA-binding domain;
 - (c) a second vector containing a promoter that functions in the host bacterial cell and a DNA encoding a transcription activation domain;
 - (d) a dimeric small molecule which comprises a moiety that binds a known receptor domain covalently linked to a moiety against which the unknown target is to be screened for binding;
 - (e) a means for inserting into the first vector or the second vector a DNA encoding the known receptor domain in such a manner that the known receptor domain and an expression product of the first or second vector are expressed as a fusion protein;
 - (f) a means for inserting into the first vector or the second vector a DNA encoding the unknown target receptor in such a manner that the unknown target receptor and an expression product of the first or second vector are expressed as a fusion protein; and
 - (g) a means for transfecting the host cell with the first vector, and the second vector, wherein binding of the dimeric small molecule to the unknown target receptor results in a measurably greater expression of the reporter gene than in the absence of such binding.

72. A process for screening a chemical library for a molecule that binds a known target receptor, comprising providing a chemical library, providing a bacterial cell that expresses the known target receptor as a part of a fusion protein, and identifying the molecule that binds the known target receptor in the bacterial cell by the method of claim 30.
73. A molecule identified by the method of claim 72, wherein the molecule was not previously known to bind the known target receptor.
74. A process for screening a cDNA library for a nucleic acid that encodes a receptor to which a known molecule binds, comprising providing a cDNA library, providing a dimeric molecule having two ligands, of which one ligand is the known molecule, and identifying the nucleic acid that encodes the receptor to which the known molecule binds by the method of claim 50.
75. An isolated nucleic acid identified by the process of claim 74, wherein the isolated nucleic acid was not previously known to encode a receptor to which the known molecule binds.
76. The isolated nucleic acid of claim 75, wherein the isolated nucleic acid encodes an enzyme or a portion thereof.
77. A transgenic bacterial cell comprising
- (a) a dimeric small molecule which comprises a methotrexate moiety covalently linked to a moiety capable of binding a receptor domain;
 - (b) nucleotide sequences which upon transcription encode

- i) a first fusion protein comprising a DHFR domain and a first fragment of an enzyme, and
 - ii) a second fusion protein comprising the receptor domain and a second fragment of the enzyme, wherein activity of the enzyme is conditioned on the proximity of the first fragment of the enzyme to the second fragment of the enzyme.
78. The bacterial cell of claim 77, wherein the moiety capable of binding the receptor domain is capable of binding with a IC_{50} of less than 100 μM .
79. The bacterial cell of claim 77, wherein the moiety capable of binding the receptor domain is capable of binding with a IC_{50} of less than 100 nM.
80. The bacterial cell of claim 77, wherein the moiety capable of binding the receptor domain is capable of binding with a IC_{50} of less than 1 nM.
81. A method for identifying a molecule that binds a known target receptor in a bacterial cell from a pool of candidate molecules, comprising:
- (a) forming a dimeric molecule by covalently bonding each molecule in the pool of candidate molecules to a methotrexate moiety;
 - (b) introducing the dimeric molecule into a bacterial cell culture comprising bacterial cells that express a first fusion protein which comprises the known target receptor domain against which the candidate molecule is screened, and a first fragment of an enzyme, and a second fusion protein which comprises a DHFR receptor domain and a second

fragment of the enzyme;

(c) permitting the dimeric molecule to bind to the first fusion protein and to the second fusion protein, bringing the first fragment and the second fragment of the enzyme in to proximity so as to reconstitute the activity of the enzyme;

(d) selecting the bacterial cell that exhibits the activity of the enzyme; and

(e) identifying the small molecule that binds the known target receptor.

82. A method for identifying an unknown target receptor to which a known molecule is capable of binding in a bacterial cell, comprising:

(a) providing a dimeric molecule having a first ligand which has a specificity for the unknown target receptor covalently bonded to a methotrexate moiety;

(b) introducing the dimeric molecule into a bacterial cell which expresses a first fusion protein which comprises the unknown target receptor domain, and a first fragment of an enzyme, and a second fusion protein which comprises a DHFR receptor domain and a second fragment of the enzyme;

(c) permitting the dimeric molecule to bind to the first fusion protein and to the second fusion protein, bringing the first fragment and the second fragment of the enzyme in to proximity so as to reconstitute the activity of the enzyme;

(d) selecting the bacterial cell that exhibits the activity of the enzyme; and

(e) identifying the unknown target receptor.

BEST AVAILABLE IMAGES

Defective images within this document are accurate representations of the original documents submitted by the applicant.

Defects in the images include but are not limited to the items checked:

☐ BLACK BORDERS

☐ IMAGE CUT OFF AT TOP, BOTTOM OR SIDES

☒ FADED TEXT OR DRAWING

☐ BLURRED OR ILLEGIBLE TEXT OR DRAWING

☐ SKEWED/SLANTED IMAGES

☐ COLOR OR BLACK AND WHITE PHOTOGRAPHS

☐ GRAY SCALE DOCUMENTS

☒ LINES OR MARKS ON ORIGINAL DOCUMENT

☐ REFERENCE(S) OR EXHIBIT(S) SUBMITTED ARE POOR QUALITY

☐ OTHER: _____

IMAGES ARE BEST AVAILABLE COPY.

As rescanning these documents will not correct the image problems checked, please do not report these problems to the IFW Image Problem Mailbox.
